THE LATEST ENTRANT

ATELIERS 

How is it that the latest company in the field of metal cladding has taken less than 10 years to shape its market?

“

You're familiar with the following universal theory; everyone can identify with it: one of the great enemies of humankind – of our human way of thinking – *is habit*.

The habit of **thinking within a certain framework** not because we have established it ourselves, but just because it is there, locking us into an ultimately comfortable standard process: Thinking like Mr. Average.

Our story perfectly embodies how to buck this trend: we are the latest entrant to the French metal cladding market. Despite being the most recently established company, in just over 10 years, we have built a reputation that is unrivalled in the sector, consistently outpacing the competition with our original and desirable designs; **our influence is clearly unrelated to our economic weight**.

10 YEARS

OF FIRSTS

IMPACT

- first to reinvent the aesthetics of metal clad buildings
- first to bring steel cladding into towns and cities
- first to offer a 30-year warranty
- first to invent a random facade
- first to offer low carbon steel as standard
- first selective lacquering of a pre-painted coil

IMPACT DESIGN

We have pushed back the boundaries and brought steel cladding **into cities and towns**. Offices, apartment blocks, interior design – a significant part of our business is generated by projects outside industrial buildings; steel cladding is now considered a desirable element.

We have consulted architects, builders, artisans and contractors. Together, we have radically changed the scene in just a few years. Ateliers 3S impacts on its market in terms both of building aesthetics and environmental concerns, and is creatively liberating.

This positive impact becomes yours also. It is encoded in your buildings. **Permanently.**”

IMPACT CLIMAT

Our **30-year warranty** – ensuring that our products last three times longer – was our first step in an eco-friendly approach to sustainability and economy. However, while steel can be recycled repeatedly, the recyclable volume currently available is only sufficient to meet a quarter of global demand. The future therefore lies in low carbon steel.

As of 2024, we are the first company to offer the new low carbon steel as standard. Climate concerns are not an option; by anticipating that the carbon footprint of any building will be a determining factor in its construction, we are offering our customers the opportunity to be in phase with future trends.”

OUR

STORY

Lenght Minimum: 1000mm / Lenght Maximum : 6000 mm

INSTALLATION

SLAT INTERLOCKING SYSTEM / HIDDEN FIXING

EPURE sidings are concealed fastening products.

The sidings are screwed to the framework. Each siding covers the fastening of the previous one.

In this way, the sidings fit together one after the other.

Once the façade is complete, the sidings give the effect of a standing seam, while offering a simplified installation system that requires no special folding equipment. Self-supporting, they can be fixed to all types of framework.

Be careful **not to lean on the sidings when installing them**, to avoid distortion.

FIXING THE SIDINGS

FIXING ON METAL FRAME

5,5x22mm mini

FIXING ON TIMBER FRAME

6.3x35mm mini

Screws position

The screws used for EPURE sidings are standard: self-drilling stainless steel screws with collars, sized according to the type of secondary framework chosen.

A screw must be placed at each frame-siding intersection.

EPURE sidings can be installed on metal or wood secondary frameworks and on all types of buildings: concrete or masonry load-bearing structure, metal framework with double-skin cladding or load-bearing structure consisting of a timber-framed wall, in accordance with CSTB Cahier 3747-V2 of March 2024 (see installation details below).

SECONDARY FRAMING

Metal framing «L»

Metal framing «Z»

Metal framing «Ω»

Ajustable metal framing
«Z»

Ajustable metal framing
«Ω»

Timber frame

FLATNESS OF SUPPORT

The secondary framing elements must be sized by the installation company. Metal framing should be at least 1.5mm thick.

The flatness of the support is essential when installing the panels.

Regardless of the type of secondary framework chosen (metal or wood), it must comply with **a maximum permissible co-planarity of 2mm over three supports.**

DOUBLE-SKIN INSTALLATION / VERTICAL APPLICATION

BUILDINGS WITH METAL FRAMING

The flatness of the support is very important the insulation must be positioned between the secondary framing elements and **the insulation must not be pinched** between the framing elements and the EPURE sidings. An adjustable secondary framework will ensure that the substrate is perfectly flat.

When installing the first siding, you must be careful to ensure that it is vertical, as this will determine the rest of the façade.

EXTERNAL WALL INSULATION (EWI) ON MASONRY WALLS WITH METAL FRAMING

MASONRY WALLS

The flatness of the support is very important. The adjustable square brackets ensure that the frames are perfectly flat.

When installing the first siding, care should be taken to ensure that it is vertical, as this will determine the rest of the façade.

The framework and its installation comply with Cahier CSTB 3194.

EXTERNAL WALL INSULATION (EWI) ON MASONRY WALLS WITH TIMBER FRAMING

MASONRY WALLS

The flatness of the support is very important. The adjustable square brackets ensure that the frames are perfectly flat.

When installing the first siding, care should be taken to ensure that it is vertical, as this will determine the rest of the façade.

In the case of timber framing, a ventilated air space must be provided. The framework and its installation comply with Cahier CSTB 3316.

TIMBER-FRAMED WALLS

TIMBER-FRAMED WALLS

The flatness of the support is very important, it may be necessary to ensure that the frames are perfectly flat.

When installing the first siding, care should be taken to ensure that it is vertical, as this will determine the rest of the façade.

In the case of timber framing, a ventilated air space must be provided. The framework and its installation comply with Cahier CSTB 3316.

INSTALLATION ON EXISTING DOUBLE-SKIN CLADDING

RENOVATING A BUILDING WITHOUT REMOVING THE EXISTING CLADDING

The flatness of the support is very important, it may be necessary to ensure that the frames are perfectly flat.

When installing the first siding, care should be taken to ensure that it is vertical, as this will determine the rest of the façade.

HORIZONTAL EXPANSION JOINT

Dimensions EPURE sidings :

- Minimum length : 1000 mm
- Maximum length : 6000 mm

In the case of high facades, several sidings will be needed to cover the facade.

To ensure a watertight seal, it is advisable to use a drip-edge profile between each level.

Tip: This drip-edge profile can be used to play on the grids, by staggering the sidings from one level to the next.

INSTALLATION DIRECTION

Whenever this does not conflict with prevailing wind calculations, it is strongly recommended that the sidings are installed with the same standing seam orientation from one façade to the next.

The regularity of the shadows cast will add aesthetic appeal to the project.

FINISHING PROFILES

Beyond the aesthetic quality of its sidings, a successful metal facade requires precise and well-designed finishing profiles. ATELIERS 3S takes particular care to offer discreet elements that connect with the styles of the associated cladding.

In these pages, you'll find a selection of models that are fully adaptable to the actual dimensions of your project.

No matter how precise your installation is, **finishing profiles will always be custom-made elements.** Please don't hesitate to provide us with your exact dimensions and any other installation drawings.
